

SEA BLOCKCHAIN WEEK 2026 · HACKATHON

AttestRWA

Settlement Attestation Layer for RWA — on-chain compliance bridge for stablecoin real-world-asset settlements.

| We do not tokenize property. We tokenize the fact that a bank verified the deal.

Aleksandr Mordvinov

Apache-2.0

Base Sepolia · EAS

PROBLEM

RWA settlements grew 8x. Compliance did not.

- Stablecoin is the default rail for cross-border RWA in 2026
- Tokenization is solved — Centrifuge, RealT, Ondo, Maple
- Banks have no standard way to signal **bank-grade** on-chain
- Buyers wire USDC to unverified payees · regulators lack audit trails

SOLUTION

One attestation schema. Any RWA. Any bank.

ON-CHAIN

- `SettlementApproval` EAS schema (10 fields)
- `SettlementEscrow.sol` — release only on valid attestation

OFF-CHAIN

- FastAPI attester — payee, capital class, evidence
- Compliance YAML DSL — bank policy as code

We are the composable layer tokenization platforms plug into — not another RWA token.

HOW IT WORKS

Attest → enforce → settle

Buyer wallet → deposits Mock USDC → SettlementEscrow

Attester service → checks payee feed + capital + RAG evidence

Attester signs → EAS SettlementApproval on Base

Escrow reads attestation → **release** to verified payee

OR payee mismatch → **reject** → buyer refund · full audit trail on-chain

DEMO

Both paths proven — approve and reject

- **Happy path:** attestation valid → escrow releases to verified payee
- **Reject path:** payee mismatch (SRL Holding 2026 vs authorized entity) → no release → refund
- Real EAS bytecode on Anvil fork of Base Sepolia — one command: `./scripts/demo-mode.sh`
- 85-second demo video with English subtitles

DIFFERENTIATION

Not tokenization. Not KYC. The missing primitive.

WE ARE NOT

- Another RWA token platform
- A new KYC provider or stablecoin
- A private permissioned chain

WE ARE

- Public composable EAS schema
- Bank-as-attester model
- Escrow-enforced compliance signal
